

## INCIDENTAL - Status Module (Ethan Skidmore)

### Algorithms and UI Design

#### Incident

MakeReport(string text) method of Incident Class

- # ensure report has valid text, is not empty
- if text is null or empty, return
- # Create a new report object using its index as the id and passed text as the description, and grabbing the current time from the timeline module to use as the timestamp
- newReport = new Report(userReports.length + 1, text, Time.CurrentTime())
- oldReports = userReports
- userReports = new Report[oldReports.length + 1]
- # Extend reports array to accommodate new report
- foreach i in [0, oldReports.length - 1]
  - userReports[i] = oldReports[i]
- userReports[userReports.length - 1] = newReport

UpdateStatus(Status newState) method of Incident Class

- # Simple, update state member
- state = newState

#### User

AddIncident(Incident newIncident) method of User Class

- # Extend incidents array
- oldIncidents = incidents
- incidents = new Incident[oldIncidents.length + 1]
- # Loop through old incidents and add to new array
- foreach i in [0, oldIncidents.length - 1]
  - userIncidents[i] = oldIncidents[i]
- # Add target incident to end of new array
- incidents[incidents.length - 1] = newIncident

AddStatusPreset(StatusPreset newPreset) method of User Class

- # Extend status presets array
- oldPresets = statusPresets
- statusPresets = new StatusPreset[oldPresets.length + 1]
- # Loop through old presets and add to new array
- foreach i in [0, oldPresets.length - 1]
  - statusPresets[i] = oldPresets[i]
- # Add target incident to end of new array
- statusPresets[statusPresets.length - 1] = newPreset

#### StatusPreset

SerializeToPreset(Status statusToSerialize) method of StatusPreset Class

- statusFields = JsonSerializer.Serialize(statusToSerialize)

DeserializeFromPreset() method of StatusPreset Class

- return JsonSerializer.Deserialize(statusFields)

SaveToFile() method of StatusPreset Class

- file = Open new file {Preset File Name}
- file.write(statusFields)

LoadFromFile() method of StatusPreset Class

- file = Open file {Preset File Name}
- statusFields = file.read(statusFields)

## **Status**

Serialize() method of Status Class

# Create and serialize this status to a preset

- statusPreset = new StatusPreset()
- statusPreset.SerializeToPreset(this)
- return statusPreset

UI

**CURRENT STATUS**
